

Environmental policy of Iskraemeco

We, at Iskraemeco, d.d. , are aware that the use of substances and natural sources for our products, activities and services causes a direct impact on the environment. Consequently, all employees strive to preserve the environment and provide favourable living conditions for future generations. Permanent improvements in the field of environmental management are implemented by the integrated management system, by setting up the objectives to minimize negative impacts on the environment and by setting up the programmes for their implementation.

The following measures are taken to minimize the environmental burden:

- With our activities, products and services, we respect and meet the requirements of valid environmental legislation, regulations and other adopted documents,
- We materialise our activities, products and services by constantly improving our proficiency with appropriate environmental management and by preventing pollution in accordance with the currently available state-of-the-art technique,
- Materials that are harmful to the environment are replaced with materials, which are more environment-friendly and can be reused, re-cycled or safely disposed of,
- The volume of waste is reduced by better utilisation of raw materials. Only unavoidable, previously processed residues are deposited,
- When planning new products we take in consideration the entire product life cycle, from its development to the relevant management after expiry of its life span,
- We create a more responsible attitude towards the environmental issues by regular training and raising the staff's awareness,
- Successful implementation of measures for environmental protection is evaluated by periodic internal audits, which are carried out by properly trained auditors.
